

Application Data Structure

1. User

The application contains user/profile information such as:

Field	Example
Full Name	Muhammad Haseeb
Email	haseeb@example.com
Phone Number	+92 300 1234567
Username	haseeb
Country	Pakistan
Currency	PKR
Profile Image	User avatar

2. Transaction

Transactions represent money coming into or going out of the user's account.

Field	Example
ID	1
Type	income / expense
Title	Upwork
Amount	\$850.00
Date	Feb 20, 2022
Time	10:00 AM
Status	Income / Expense
Source	Upwork Escrow

Field	Example
-------	---------

Image	Transaction image
-------	-------------------

Income-specific information

Field	Example
-------	---------

Earning	\$870.00
---------	----------

Fee	-\$20.00
-----	----------

Total	\$850.00
-------	----------

Expense-specific information

Field	Example
-------	---------

Spending	\$85.00
----------	---------

Fee	-\$0.99
-----	---------

Total	\$84.00
-------	---------

3. Wallet

The wallet currently contains information such as:

Field	Example
-------	---------

Total Balance	\$2,548.00
---------------	------------

Connected Card Debit Card

Card Number	**** * 8075
-------------	-------------

Card Holder	IRVAN MOSES
-------------	-------------

Expiry	22/01
--------	-------

The wallet also contains:

- Add
- Pay

- Send
 - Transactions
 - Upcoming Bills
-

4. Connected Payment Methods

The Connect Wallet flow currently supports the following connection methods:

- Debit Card
- Bank Link
- Micro Deposits
- PayPal

The current implementation is primarily UI-based. **Backend persistence and actual payment/bank integration have not yet been implemented.**

5. Important Backend Note

Add this paragraph exactly because it will be useful when your colleague begins the Django backend:

Backend Integration Note:

The current React Native application uses local/static data for UI development and navigation. A Django backend is planned for a future phase. The backend will be responsible for persistent user data, authentication, transactions, wallet information, and connected payment methods. The exact database schema and API contracts will be defined during backend integration.
